

GitHub Campus Experts & MLSA

Application Essay — Building a Peer Coding Community

As a Computer Science student, I believe that the best way to grow as a developer is by learning together, sharing knowledge, and building projects with peers. My motivation to build a peer coding community on campus comes from the desire to create an environment where students can learn beyond classrooms and gain practical experience through collaboration.

Many students are interested in coding but struggle to find the right guidance, resources, or supportive community. I want to bridge this gap by creating a student-led community where beginners can start without hesitation and experienced students can strengthen their skills by mentoring others. Through regular coding sessions, workshops, hackathons, peer-learning sessions, and technical discussions, I aim to make technology learning more accessible and engaging.

GitHub tools can play an important role in this initiative. Students can learn real-world development practices through repositories, issues, pull requests, branches, and collaborative projects. I also want to encourage students to build meaningful open-source projects that demonstrate their skills and help them create strong developer portfolios.

As a potential GitHub Campus Expert and MLSA, I hope to connect students with global developer communities, Microsoft and GitHub learning resources, and opportunities to participate in technical events. My goal is not simply to create another coding club, but to build a sustainable culture of collaboration where students help each other grow.

Ultimately, I want every student to feel that they have a place to learn, contribute, experiment, and become confident in technology.
